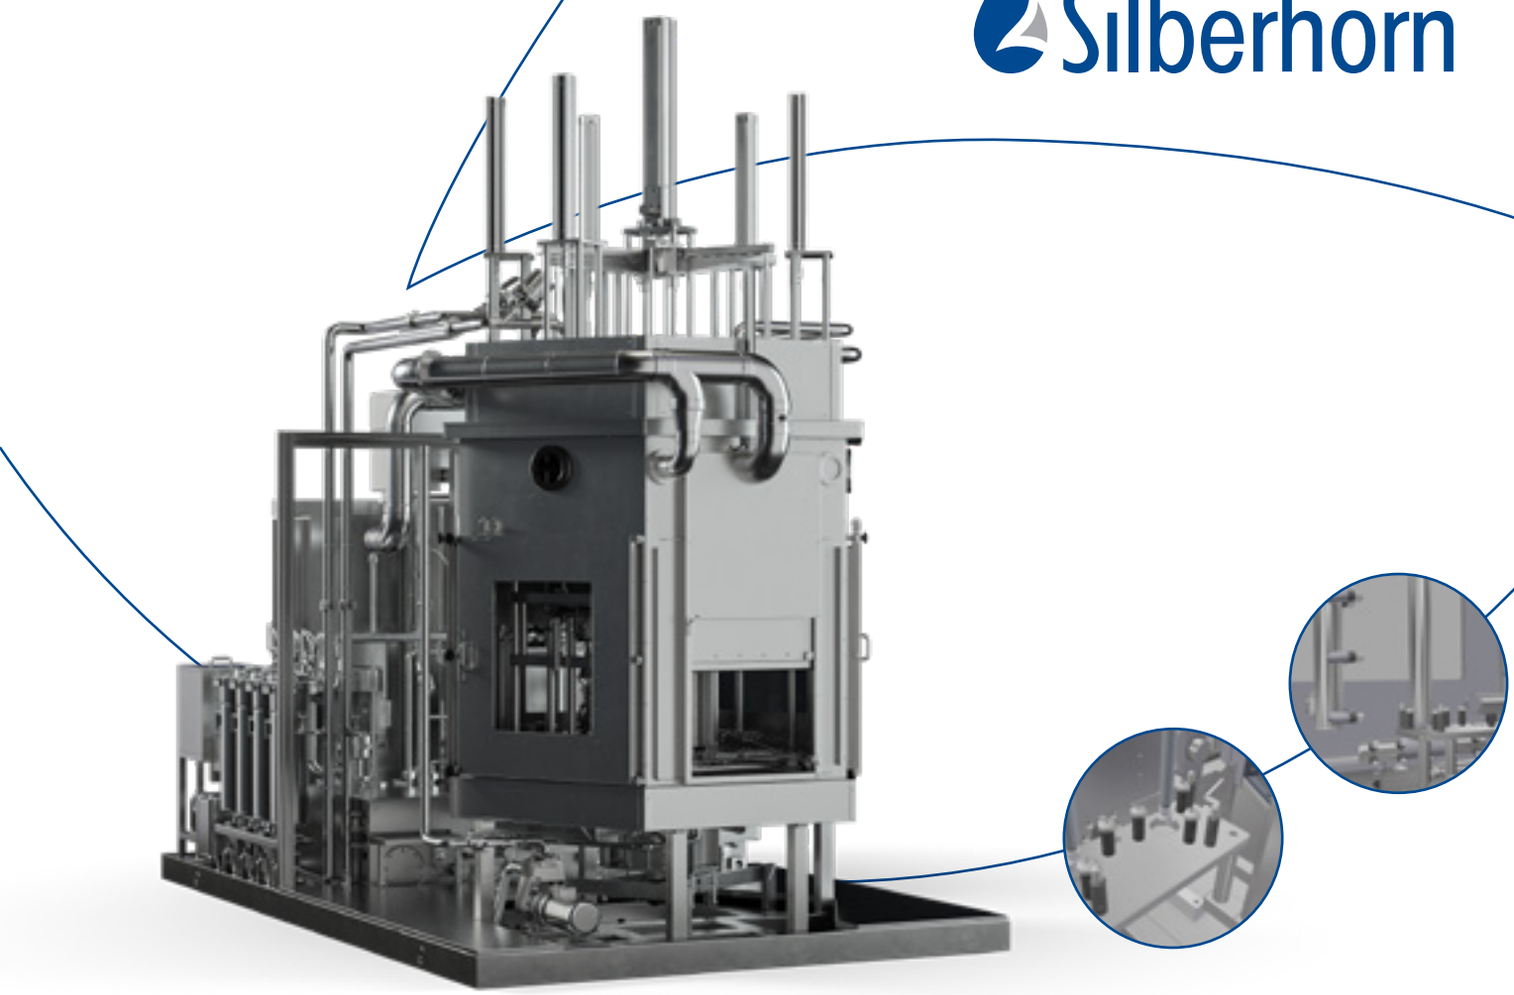
Maschinenbau Silberhorn



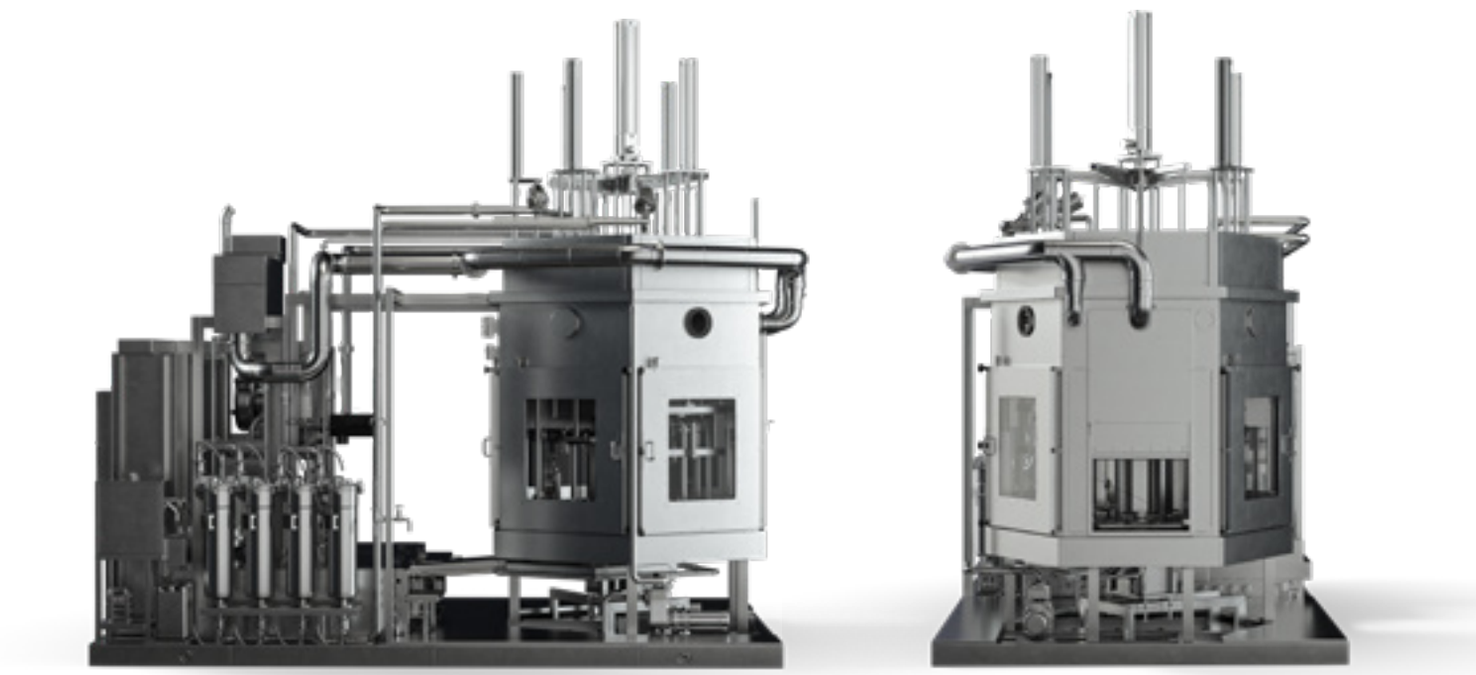
Multi-station rotary table

In the **multi-station rotary table**, Silberhorn combines effective HD waterjet rinsing with targeted individual parts cleaning. The system was developed specifically for use in production lines. For example, the cleaning batches are individually adapted to the respective cycle times; even the shortest cycle times of less than 20 seconds can be implemented. The stable and modular design allows the integration of very different cleaning solutions as well as a highly variable station layout.

Highlights

- Cleaning cycles in step with production, cycle times of less than 20 seconds are feasible
- Integration of various mechanical cleaning aids is possible depending on requirements: for example in the form of retracting spray lances or an adapted pressure flushing system
- On request with HD waterjet rinsing units including supply and treatment solution: spray pressures up to 1,500 bar
- Combination of several cleaning, rinsing and processing steps in individually configured stations. Tried and tested are 4-, 6-, 8- and 10-station rotary tables
- As standard, all system parts in contact with the medium are made of stainless steel

Maschinenbau Silberhorn



Component parts and options

- Bag filter
- Candle filter
- Magnet separator
- Automatic loading and unloading - with integrated vacuum drying if required
- Gravity oil separator
- Process visualization
- Process monitoring package
- Steam vapor condenser
- Automatic cleaner re-dosing
- Recirculating air drying station
- Vacuum drying station
- Pump-off device
- Viewing window with lighting
